Week 2: **Skills for the use of different library and information source and resources, e.g. catalogues, abstracts, indexes, bibliographies, books, databases, etc**.

Skill-A skill is the ability to perform a task or activity with competence and proficiency. Skills can be acquired through education, training, practice, or experience. Skills are essential in various aspects of life, including personal development, professional growth, and academic achievement. They help individuals perform effectively in their roles and adapt to different situations.

Catalogue: A library catalogue is a fundamental tool for any library as it provides users with the means to locate and access the resources available in the library. It is a comprehensive and organized listing of books, journals, periodicals, and other resources held in the library's collection.
Skiils Needed

1. **Understanding Search Techniques**: Knowing how to use keywords, Boolean operators (AND, OR, NOT), and advanced search options to refine searches.

2. Evaluating Sources: Assessing the relevance, credibility, and quality of the sources retrieved from the catalogue.

3. Navigating Library Systems: Familiarity with the library's catalogue system (such as OPAC - Online Public Access Catalog), whether it's a physical card catalogue or a digital database.

LIS 112 LECTURE NOTE: NOT FOR SALE

4. Using Digital Tools: Ability to use computers, tablets, or other devices to access the library's online catalogue, including understanding how to utilize search filters and sorting options.

5. Interpreting Results: Ability to analyze search results, understand bibliographic records, and determine which items are most relevant to your needs.

6. Cross-Referencing Information: Ability to cross-check information within the catalogue to find related materials.

7. Reading Bibliographic Records: Carefully reading the details provided in each catalogue entry, such as titles, authors, publication dates, and call numbers, to locate the correct item.

8. Noting Call Numbers and Locations: Accurately recording call numbers and the physical or digital location of the items for retrieval.

9. Troubleshooting Searches: Adjusting search strategies when initial attempts do not yield the desired results, such as using different keywords or exploring alternative resources.

difficulties.

10. Navigating Physical Spaces: Understanding the layout of the library, including sections, floors, and specific areas where different types of materials are stored.

11. Locating Items: Knowing how to find items on the shelves based on call numbers and understanding the library's classification system (e.g., Dewey Decimal System, Library of Congress Classification).

ABSTRACTS: An abstract is a summary of a research paper, thesis, dissertation, article, or other scientific or academic document. It provides an overview of the main points and findings of the document, allowing readers to quickly determine the paper's purpose and whether it is relevant to their interests.

SKILLS NEEDED IN USING AN ABSTRACT

1. **Quick Understanding**: Ability to read and quickly grasp the main ideas and findings presented in the abstract.

2. Evaluating Relevance: Assessing whether the abstract's content is relevant to your research question or area of interest.

LIS 112 LECTURE NOTE: NOT FOR SALE

3. Analyzing Quality: Judging the credibility and quality of the research based on the information provided in the abstract.

4. Effective Searching: Knowing how to locate abstracts in databases, journals, and other academic resources.

5. Using Keywords: Using appropriate keywords and search strategies to find relevant abstracts quickly.

6. Condensing Information: Ability to summarize the main points of the abstract in your own words, which is useful for notetaking and understanding.

7. Checking Accuracy: Ensuring that the abstract accurately reflects the content and scope of the full research paper.

8. Connecting Concepts: Relating the findings in the abstract to broader theories, concepts, or other research in the field.

9. **Efficient Reviewing**: Quickly determining the relevance and quality of an abstract to decide whether to invest time in reading the full paper.

10. Prioritizing: Knowing which abstracts to prioritize based on their relevance to your work or research goals.

INDEXES: An index is found at the back of a book. It alphabetically lists all the major topics, events, people, and places discussed in the book and provides page numbers that direct you to each reference. Indexes are valuable tools for quickly finding specific information within a large body of text or data, saving time and enhancing the efficiency of research and information retrieval.

Skills Needed to Use an Index Effectively:

1. **Understanding the Structure**: Knowing how indexes are organized (alphabetically, thematically, etc.) and how to navigate them.
2. **Identifying Relevant Keywords**: Being able to identify and search for relevant keywords or terms related to the information you seek.
3. **Using Cross-References**: Utilizing cross-references to find related information and broaden your search.
4. **Attention to Detail**: Paying close attention to the details in index entries to accurately locate the information.
5. **Analytical Skills**: Analyzing the entries and determining which references are most pertinent to your needs.

LIS 112 LECTURE NOTE: NOT FOR SALE

BIBLIOGRAPHIES: A bibliography is a list of sources used in research, such as books, journals, or websites. It's usually found at the end of a research paper, book, or article. Bibliographies are also known as "Works Cited" or "References". They are an important part of properly citing research and avoiding plagiarism.
A bibliography typically includes:

- The authors' names
- The titles of the works
- The names and locations of the publishers
- The dates of publication
- Page numbers if the sources are part of a multi-source volume

<u>Skills Needed to Use Bibliographies</u>

1. Familiarize yourself with different citation styles (e.g., APA, MLA, Chicago, Harvard, etc.). Each style has its own rules for how to format entries in the bibliography (also called a reference list or works cited list).

2. Identify the required elements for each source. For books, this usually includes:

- Author(s)
- Title of the work

    - Publisher
    - Year of publication
- For articles, you'll need:
    - Author(s)
    - Title of the article
    - Journal name
    - Volume/issue number
    - Page range
    - Year of publication
- For online sources:
    - Author(s) (if available)
    - Title of the webpage/document
    - Website name
    - URL
    - Date of publication (if available)
    - Date of access (if applicable)

3. Organization of Sources

- Alphabetize your sources by the author's last name or the title (if no author is listed).
- If there are multiple works by the same author, list them chronologically by year of publication, or follow the specific guidelines of the citation style you're using.
- Be aware of the differences between footnotes (These are citations that appear at the bottom of the page they refer to) endnotes (whereas endnotes appear at the end of a manuscript) and bibliographies (This is the full reference, written alphabetically at the end of the work): Bibliographies generally list sources you referenced in your work, whereas footnotes or endnotes provide additional information or clarification.

LIS 112 LECTURE NOTE: NOT FOR SALE

4. Quoting and Paraphrasing Correctly

- Use direct quotes when you need to preserve the exact wording of a source.
- Paraphrase effectively to restate ideas in your own words while still giving credit to the original source.
- Avoid plagiarism by always citing sources whenever you use someone else's ideas, data, or words.

5. Proper Formatting

- Each citation style has specific rules for formatting the bibliography (e.g., italicizing book titles, capitalizing article titles differently, punctuation between elements, etc.).
- Ensure proper indentation, most styles require a hanging indent for bibliography entries, meaning the first line is flush left and subsequent lines are indented.

6. Evaluating Sources

- Assess the reliability and relevance of the sources you include in your bibliography. Academic journals, books from reputable publishers, and credible websites are preferred over personal blogs or unreliable sources.

- Keep track of the publication date of each source to ensure you're using up-to-date or historically accurate materials.

7. Managing Citations with Tools

- Use citation management tools like Zotero, EndNote, or Mendeley. These tools can help you collect, organize, and format your bibliography correctly.
- Many citation management tools can automatically generate bibliographies in various citation styles, saving time and reducing errors.

8. Cross-checking for Accuracy

- Always double-check your citations for accuracy. Even minor errors (e.g., missing commas, incorrect spelling) can affect the credibility of your work.
- Verify that all of the information is correct and complete — for example, make sure you have the correct page numbers or web addresses.

9. Follow your citation guide's recommendations for citing these sources accurately.

- **Consulting Style Guides:** Refer to the official style manual or online resources if you're unsure about a particular citation. For example:
  - *The Chicago Manual of Style* for Chicago-style citations.
  - *The MLA Handbook* for MLA citations.
  - *The Publication Manual of the American Psychological Association* (APA) for APA citations.

LIS 112 LECTURE NOTE: NOT FOR SALE

11. Citation Ethics

- Give proper credit to all sources of information, regardless of whether the source is a primary or secondary one.
- Do not fabricate or omit references. this can lead to serious ethical breaches in academic and professional settings.

BOOKS: A book is typically defined as a set of written, printed, or illustrated pages, often bound together and protected by a cover. It is a medium for presenting information, stories, or ideas, usually in a structured form, such as chapters, sections, or volumes. Books come in various formats, including physical print (hardcover or paperback) and digital (e-books, audiobooks), Databases, etc.

SKILLS FOR USING A BOOK EFFECTIVELY

1. Skimming and Scanning: For a quick overview, you can skim through the introduction, headings, and subheadings to get a sense of the book's structure and main ideas. Scanning is useful for locating specific information, such as definitions or key concepts.

2. Active Reading: This involves engaging with the text by asking questions, highlighting key points, taking notes, and reflecting on the material as you read.

3. Critical Reading: Analyze the author's arguments, assumptions, and evidence. Question the content, look for biases, and evaluate the credibility of the information.

4. Reading for Comprehension: Focus on understanding the meaning behind the text. If you encounter difficult sections, reread or break them down into simpler parts.

5. Highlighting and Underlining: Use highlighting or underlining to mark key passages, quotes, or ideas. However, avoid overdoing it to ensure you focus on the most important information.
6. Margin Notes: Write brief comments, summaries, or questions in the margins to help you remember and engage with the material.
7. Taking Notes: For deeper understanding, write detailed notes on chapters or sections. Summarize what you've read in your own words and jot down any connections you can make to prior knowledge.
8. Familiarize Yourself with the Table of Contents: This gives you an overview of the book's structure, helping you navigate it more efficiently.
9. **Identifying Key Sections:** Recognize the introduction, main chapters, conclusion, and appendices. Often, these sections will contain important concepts, findings, or summaries of the material.
10. Historical Context: For historical or scholarly books, understanding the time period in which the work was written can offer valuable insights into its meaning and purpose.
11. **Summarizing:** After reading a section or chapter, take a moment to summarize the main points in your own words. This helps to solidify the information in your memory.
12. Mind Mapping: Create mind maps to visually organize the book's main ideas and their relationships. This can help you connect concepts and make them easier to recall.
HS 112 LECTURE NOTE: NOT FOR SALE
13. Reviewing: Revisit your notes or the book periodically to reinforce your understanding and retention of the material.
14. Teach Others: Explaining what you've learned to someone else is a great way to test your understanding and reinforce your memory of the content.
15. Specific Information: Use the index, glossary, or bibliography to find detailed information or to look up key terms, concepts, or references.
16. Cross-Referencing: Check footnotes, endnotes, or references to explore further reading and to verify the information presented in the book.
17. Setting Reading Goals: Break the book into manageable sections and set goals for how much you want to read each day or week. This helps avoid feeling overwhelmed, especially when reading large or dense texts.
18. Pacing Your Reading: Adjust your reading speed based on the complexity of the material. For challenging or dense sections, slow down and reread as necessary. For lighter, narrative sections, you can read more quickly.
19. Reflecting on the Material: After finishing the book, take time to reflect on its lessons or themes. How has your perspective changed, and how can you incorporate this new knowledge into your life or practice?

10. Comparing with Other Works: When possible, compare the ideas or arguments in the book to those of other authors on the same subject. This can deepen your understanding and sharpen your critical thinking skills

DATABASE

A database is a structured collection of data that's stored electronically and organized for easy access, management, and updating. Databases can store any type of data, including numbers, words, images, videos, and files. It is designed to efficiently store, retrieve, and manipulate data, often used by organizations and individuals to manage large volumes of information.

SKILLS NEEDED TO USE DATABASES

1. **Understand Basic Database Concepts**: Familiarize yourself with the fundamental concepts of databases, including tables, fields (columns), records (rows), relationships, and keys (primary and foreign keys).
2. **Data Types**: Understand the various data types (e.g., integer, text, date) and how they are used to store different kinds of data in a database.
3. **Knowledge of SQL (Structured Query Language)**: Mastering SQL is one of the most important skills for working with databases. SQL is the language used to interact with relational databases.

LIS 112 LECTURE NOTE: NOT FOR SALE

Basic Queries: Learn to use SELECT, INSERT, UPDATE, and DELETE statements to interact with data.

Filtering Data: Use WHERE, AND, OR, and IN to filter data based on specific criteria.

Joining Tables: Learn how to combine data from multiple tables using JOIN (INNER, LEFT, RIGHT, and FULL joins).

Aggregating Data: Use functions like COUNT(), SUM(), AVG(), MAX(), MIN() to aggregate data.

Grouping Data: Use GROUP BY and HAVING to organize data into groups and apply aggregation to each group.

Sorting Data: Use ORDER BY to sort query results by one or more columns.

Advanced SQL:

Subqueries: Learn how to use subqueries (nested queries) to filter or aggregate data in more complex ways.

4. **Schema Design**: Develop an understanding of how to design an efficient database schema that defines the structure of the database, relationships between tables, and constraints (e.g., foreign keys, unique keys).
5. **Backup and Recovery:** Understand the importance of regular backups to protect against data loss and learn how to perform database restoration when needed.

6. Access Control: Understand how to manage user permissions and roles within the database to restrict access to sensitive data.

7. **Encryption:** Use data encryption both in transit and at rest to secure sensitive information.

8. Handling Concurrent Users: Understand how databases handle multiple users accessing and modifying data simultaneously. This involves using locking mechanisms (e.g., row-level locking) and isolation levels (e.g., read committed, serializable) to prevent conflicts and maintain data consistency.

9. **Regular Maintenance Tasks**: Understand routine database maintenance tasks such as updating statistics, rebuilding indexes, and checking for corruption.

10. **Database Migration**: Learn how to migrate data between different database systems (e.g., from MySQL to PostgreSQL) or upgrade versions of your existing database.

11. **Reporting Tools**: Know how to use reporting and business intelligence (BI) tools (e.g., Tableau, Power BI, or SQL-based reporting systems) to query and visualize data.

12. **Data Aggregation:** Be able to create complex reports with grouping, sorting, and filtering, and use window functions to perform advanced calculations like running totals and averages over time.

13. **Data Warehousing:** For large-scale analytical tasks, understand the concepts of data warehousing and how to aggregate data from multiple sources into a central repository for reporting and analysis.

14. **Documenting Database Structure:** Document the schema, relationships, and any special rules or constraints used in the database design.
